MINDER & THE WORLD MODEL
FOR CHIEF OPERATORS

More output, fewer rejects, *less energy.* From the plant you already have.

Minder connects your plant's data, flags what needs attention and helps your people act on it. Its World Model is learning to predict what each decision will do to throughput, yield and energy.

London, United Kingdom · celesnity.com

THE PROBLEM

Every system in your plant is right. *The plant is still late.*

Your systems record the plan. Your floor runs on unwritten rules. The gap between the two is output, quality and energy you already pay for.

SOUND FAMILIAR?

THROUGHPUT

"Day shift made 920. Night shift made 760. Same line, same product. Nobody can tell me why."

YIELD

"Quality found the defect. Nobody can trace which machine or batch caused it."

ENERGY

"The energy bill keeps rising. Nobody can tell me which machines are behind it."

WHAT YOU GET

Three numbers on your scorecard, *moved together.*

01

Throughput

More good output per hour, from fewer unplanned stops, earlier fixes and balanced lines.

MEASURED AS

Units per hour and OEE, by line and shift

02

Yield

More right first time. Defects traced to their machine, material or shift, and drift caught before it becomes scrap.

MEASURED AS

First pass yield, scrap and rework

03

Energy saved

Less energy for every unit you make, by finding idle running, wasted cooling and costly hours.

MEASURED AS

kWh per unit or per kg, by line and machine

Each number is baselined in week one of your pilot and measured on your own data.

PROOF · SAIGON FOOD · FOOD PROCESSING, HO CHI MINH CITY

Four weeks of data found three things to act on. *One is already fixed.*

17%

Energy saving identified across the whole plant

Identified by Saigon Food's engineering team. To be metered in the paid pilot.

ENERGY	A cold store compressor ran 95% of the time, yet on its worst day the room held its range only 51% of the time. Next: check loading, icing and refrigerant.
LINE USE	The freezing load sat on two of three IQF lines; the third ran one day in five. To check against the product schedule.
FOOD SAFETY	A cold store probe gave invalid readings 98% of the time, a fault present since 1 October. Now fixed, with alerts on.

Source: Minder platform data, 13 to 17 October 2026

WHY A WORLD MODEL

Push one number and the other two move. *The World Model sees all three.*

Run a line faster and output rises, but so do energy per unit, machine wear and rejects. Each system you own watches only one of them.

Our unique World Model learns from the physical record of every action on your floor. It is built to predict what each decision will do to all three, before you act. First tests on real plant data begin in November 2026.

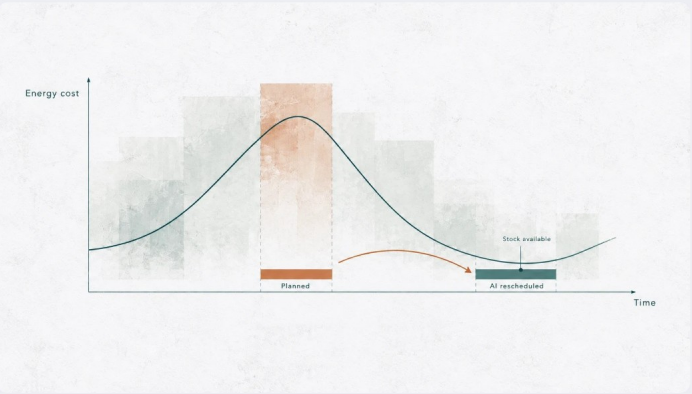

ASK BEFORE YOU ACT

Ask it what happens next, *before you act.*

A PLANT MANAGER ASKS

"Can we freeze tonight's batch after the evening peak tariff and still make tomorrow's truck?"

RUN NOW

Highest energy cost

Delivery: on time
Energy cost: peak tariff
Quality risk: low

SHIFT TO OFF PEAK

Recommended

Delivery: on time
Energy cost: lower
Quality risk: low, freezing capacity holds

WAIT UNTIL TOMORROW

Promise breaks

Delivery: misses the truck
Energy cost: lowest
Quality risk: higher, product waits

Illustrative of what the World Model is for. A change like this is recommended only after planned trials prove it.

FOUR WAYS IN

Four ways in. *Each one moves the numbers you report.*

Predictive maintenance

Reads wear in current, vibration and run hours, and marks when to service before it fails.

Throughput · Yield · Energy

Saigon Food: compressor current and vibration, measured continuously.

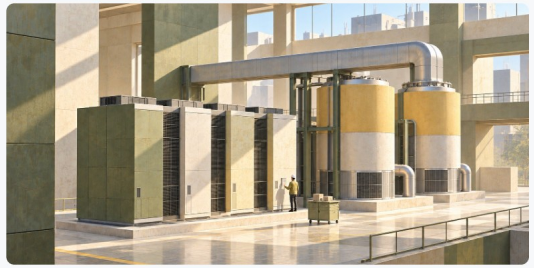

Downtime planning

Plans stops, defrosts and services into low load windows, and balances work across lines.

Throughput · Energy

Saigon Food: run hours for every freezing line, from live data.

Energy saving

Finds idle running and wasted cooling, and shifts batches to cheaper hours.

Energy

Saigon Food: 17% energy saving identified across the plant, to be metered.

Worker empowerment

Gives every shift the plant's best fix at the machine, and fills their logs automatically.

Yield · Throughput

Saigon Food: shift logs filled automatically; reports from one question.

Blue line: the numbers each use case moves

WHAT IT IS WORTH

What it could be worth *to a plant like yours.*

Number	Illustrative plant	Conservative gain	Value a year
Energy saved	£3.0m energy bill	10% less	£300k
Throughput	£80m revenue, 25% contribution margin	2% more good output	£400k
Yield	£2.0m scrap and rework	15% less	£300k
Total			£1.0m

Illustrative inputs for a mid-size food plant; replace them with yours. Recurring benefits only: one-off fixes are counted separately. Energy means lower consumption, not cheaper tariff hours. Throughput assumes the extra output sells.

ILLUSTRATIVE VALUE A YEAR

£1.0m

Our target: the whole plant subscription pays back within 12 months.

A target, not a guarantee. The pilot measures whether your plant gets there.

WHY IT COMPOUNDS

Better every shift. *Smarter with every plant that joins.*

Your plant

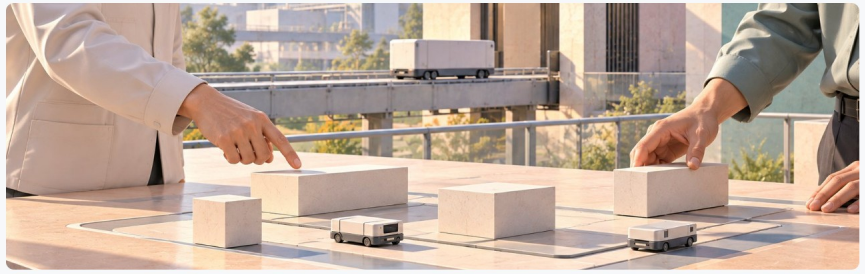

Every decision, fix and outcome is kept, so each shift starts from what the last one learned.

Your people

Expert know-how stays in the plant when the expert retires or is off shift.

Every plant

Plants that opt in make the shared model smarter for all of them. Your data never trains it without your written consent.

Live today	Connects, monitors, alerts and records
From November 2026	First predictions tested on real plant data
2027	Acts on approved decisions, proven by trials

HOA PHAT — World Model founding partner

Southeast Asia's largest steel maker

LOW RISK TO START

Live in four weeks. Nothing replaced. *Your people decide.*

Live in four weeks

At Saigon Food, from survey to live data in four weeks.

Nothing replaced

Minder reads from the systems and machines you already run.

Your people decide

Every action that matters is approved by a person.

Your data stays yours

You own your raw data. It never trains shared models without your written consent.

HOW TO START

A 12 week paid pilot, on one area or the whole plant, *decided on your numbers.*

WEEKS 1 TO 2

Survey and baseline

We map how work really flows, agree the pass or fail criteria and sign the baseline with you.

WEEKS 3 TO 5

Connect

Sensors, meters and your existing systems connected. Nothing replaced.

WEEKS 5 TO 10

Run at full load

Alerts, shift logs and energy by line. Every exception logged with what Minder changed.

WEEKS 11 TO 12

Decide

Results measured against the baseline. You decide whether to continue.

Our target: the whole plant subscription *pays back within 12 months.*

A target, not a guarantee. The pilot measures whether your plant gets there; you decide on that evidence.

Sign within 60 days of the result and the pilot licence fee is credited to your first year.

Founding plants get priority access to the World Model, built around their KPIs, at founding prices.
